ANSHIKA PATEL

BCA Student | Artificial Intelligence
Invertis University
a82882680@gmail.com | GitHub | LinkedIn

Profile

First-year BCA Artificial Intelligence student fascinated by the intersection of technology, human behaviour, and meaningful problem-solving. Curious about how intelligent systems work, how people think, and how thoughtful design can turn complex ideas into useful experiences. Eager to explore, learn, and contribute to solutions that are not only technically sound but also shaped around real human needs.

Education

Invertis University 2026 – Expected 2029
Bachelor of Computer Applications (BCA) in Artificial Intelligence

Technical Skills

Programming: Java (foundational knowledge)
Web Technologies: HTML5, CSS3, JavaScript fundamentals
AI & Cybersecurity: Introductory AI-based threat detection, IP traffic analysis, and packet inspection concepts
Tools & Platforms: GitHub, Overleaf, Notion
Project Technologies: React.js, Scapy, Ollama, and local Large Language Models (LLMs), explored through team projects
Professional Skills: Research, feasibility analysis, presentation, collaboration, communication, and problem-solving

Hackathons & Projects

AI-Based Detection of Cyber Threats in Unidirectional IP Traffic
Smart India Hackathon (SIH) | First Round Cleared | Team Project

- Contributed through research, information gathering, feasibility analysis, and collaborative problem-solving.
- Took initiative in team coordination and helped refine the proposed AI-based cybersecurity approach.
- Created and presented the project pitch deck, explaining the problem, proposed solution, feasibility, and technical approach.
- Explored a two-stage traffic inspection architecture: Tunnel A for traffic intake and Tunnel B for AI-assisted packet analysis and threat assessment.
- Investigated packet characteristics, such as size and quantity, for abnormal traffic identification without relying solely on encrypted payload contents.
- Explored Ollama and locally hosted LLMs for suspicious-traffic analysis and human-readable threat explanations. Proposed capabilities included DDoS detection, potential data-theft identification, threat blocking, safe-traffic forwarding, and SOC-style monitoring.

Technologies explored: Scapy, Ollama, local LLMs, React.js, HTML5, CSS3, JavaScript.

Federated Traffic-Flow Prediction with Communication-Cost Evaluation
AIORI Hackathon | PS-003

- Participating in a challenge focused on AI-driven traffic-flow prediction and communication-cost evaluation.
- Exploring federated learning concepts and the balance between collaborative learning and communication efficiency.

Digital Product Design & Entrepreneurship

The Ultimate Planner – Notion Template *Independent Project | In Development*

- Developing an all-in-one planner for tasks, budgets, goals, calendars, routines, and personal development.
- Exploring user-centred design, intuitive dashboards, organisation, and practical everyday usability.

Areas of Interest

Artificial Intelligence, Cybersecurity, Psychology & Consumer Behaviour, Business Strategy, User-Centred Design, Digital Innovation, and Digital Entrepreneurship.
